ECO-CLUB: VERMICOMPOST UNIT

Vermicomposting denotes the use of earthworms as natural bioreactors for efficient biodegradation of organic solid wastes. During this process the earthworms reduce organic garbage to worm 'castings,' a rich soil fertilizer. The product made by earthworms has many benefits. The earthworms ensure bioconversion of organic wastes into rich manure within 40-45 days under complete aerobic conditions. Earthworms are natural bioreactors having a specific body organ gizzard that act as a mill and grind the waste ingested by the worms. The gut of the worms provides optimum temperature, pH, oxygen and other favorable conditions for the worms to carry out biodegrading process. Indeed, Vermicomposting is very useful for keeping environment clean and nutrient-enrichment of agricultural soil.

In view of the importance of Vermicomposting, Swami Shraddhanand College is in the process of establishing a state-of-the-art hatchery-cum-demonstration

vermicompost unit. The unit would create awareness and motivation among students to manage domestic solid waste, crop residue, livestock dung, leaf litter and paper waste for their efficient recycling to produce vermicompost, and thus to keep environment clean and tidy.
